

Pinch Valve Configurations

All valve descriptions can be identified using the component breakdown example shown below. Sizes are indicated in 1/8" increments(e.g. 5/8" = 05).

Example Valve Description:

| | Air psi | 25 | 36 | 48 | 57 | 70 | X | X | X |

NOTE: Maximum valve actuation pressure is 90 psi. Air pressure required for "bubbletight" closure of the sleeves shown are based on factory test conditions using water as the controlled media. Differential pressures for controlling liquids and air will vary. To obtain maximum sleeve life, always use lowest air pressure necessary for complete closure.

Application specific testing is always recommended to determine the suitability of Airpinch valves and sleeves.

This information is intended to be used as a guideline only.

It is the responsibility of the user to test and determine the suitability of Airpinch valves and sleeves for any given application.

Sleeve Replacement Tools

1. Remove expired sleeve from valve housing.
2. Lubricate one end of the sleeve with a liquid soap solution.
DO NOT use a petroleum product such as WD-40™.
3. Insert the tip of the insertion tool into the replacement sleeve.
4. Place the valve body on a solid surface.
5. Start the lubricated end of the sleeve at an angle to the valve body and push it into the valve body until the top flange is seated.
6. If the bottom flange is not completely seated, use the insertion tool to wedge it into place.
7. When replacing valve end caps, be sure both flange ends are well lubricated.
